@Good luck!

A company is storing data that will not be frequently accessed in the AWS Cloud. If the company needs to access the data, the data needs to be retrieved within 12 hours. The company wants a solution that is cost-effective for storage costs for each gigabyte.

Which Amazon S3 storage class will meet these requirements?

- A. S3 Standard
- B. S3 Glacier Flexible Retrieval
- C. S3 One Zone-Infrequent Access (S3 One Zone-IA)
- D. S3 Standard-Infrequent Access (S3 Standard-IA)

Reveal Solution

Correct Answer: B

Community vote distribution

B (67%)

C (33%)

Discussion:

Ram1234hit 7 months, 1 week ago

Selected Answer: B

Amazon S3 Glacier Flexible Retrieval

Key Benefits:

Lowest storage cost among retrieval-capable storage classes.

Designed for long-term archive where data is rarely accessed.

Standard retrieval time: 3–5 hours, with the bulk retrieval option available within 5–12 hours.

Ideal for use cases where retrieval can tolerate up to 12 hours of latency.

Why Not Others?

S3 Glacier Deep Archive: Even cheaper, but retrieval can take up to 48 hours, which does not meet the 12-hour requirement.

S3 Standard-IA / S3 One Zone-IA: Faster retrieval, but higher storage costs.

S3 Intelligent-Tiering: Useful for variable access patterns, but not the cheapest for archival-only use.

upvoted 1 times

ShaiTay 1 year, 2 months ago

Selected Answer: B

B. S3 Glacier Flexible Retrieval - most cost-effective solution and standard retrievals can take up to 12 hours for retrieval, which suits the company's needs here.

upvoted 1 times

b0nb0n101 1 year, 8 months ago

S3 Glacier Flexible Retrieval: This storage class is designed for long-term archival of data that is infrequently accessed and where retrieval times of several hours are acceptable. It is the most cost-effective storage class for data that is retained for months, years, or decades. However, data retrieval times can range from a few minutes to several hours.

S3 One Zone-Infrequent Access (S3 One Zone-IA): This storage class is designed for data that is infrequently accessed but requires rapid access when needed. It stores data in a single availability zone, which makes it less expensive than other S3 storage classes, but also less resilient to availability zone failures. Data retrieval is typically instantaneous.

In the context of the question, if the company needs to access the data within 12 hours, both S3 Glacier Flexible Retrieval and S3 One Zone-IA could meet this requirement. However, S3 One Zone-IA would provide faster access times when the data is needed.

. S3 One Zone-Infrequent Access (S3 One Zone-IA)

upvoted 1 times

chalaka 1 year, 8 months ago

S3 One Zone-IA (Infrequent Access) costs \$0.01/GB whereas S3 Glacier Flexible costs \$0.0036/GB.

upvoted 4 times

chalaka 1 year, 9 months ago

Selected Answer: B

S3 Glacier Flexible Retrieval.

S3 One Zone-IA (Infrequent Access) costs \$0.01/GB whereas S3 Glacier Flexible costs \$0.0036/GB.

upvoted 2 times

Jezzo 1 year, 9 months ago

S3 Glacier Flexible Retrieval – Use for archives where portions of the data might need to be retrieved in minutes. Data stored in the S3 Glacier Flexible Retrieval storage class has a minimum storage duration period of 90 days and can be accessed in as little as 1-5 minutes by using an expedited retrieval. The retrieval time is flexible, and you can request free bulk retrievals in up to 5-12 hours. If you delete, overwrite, or transition the object to a different storage class before the 90-day minimum, you are charged for 90 days. Amazon S3 supports restore requests at a rate of up to 1,000 transactions per second, per AWS account for S3 Glacier Flexible Retrieval.

B is cheaper than C

upvoted 2 times

0b82866 1 year, 10 months ago

Selected Answer: C

ChatGPT:

S3 One Zone-Infrequent Access (S3 One Zone-IA) is a storage class within Amazon S3 that is designed for data that is infrequently accessed but still needs to be retrievable within 12 hours. It offers a lower storage cost compared to S3 Standard and is suitable for scenarios where data durability and availability in a single Availability Zone are acceptable. This makes it a cost-effective solution for storing data that is accessed less frequently but still needs to be accessible within a reasonable timeframe.

Why not B?

S3 Glacier Flexible Retrieval (option B) is not the most suitable option for the given scenario because it's designed for long-term archival storage with infrequent access. While it does offer a low storage cost, retrieving data from Glacier typically takes longer than 12 hours because Glacier is optimized for long-term storage at a lower cost with retrieval times ranging from minutes to hours, depending on the retrieval option chosen.

upvoted 2 times

andrei97 1 year, 10 months ago

Selected Answer: C

Cost-effective -> answer is C

upvoted 2 times

stoy123 1 year, 11 months ago

Selected Answer: C

The most suitable Amazon S3 storage class for the company's needs is:

C. S3 One Zone-Infrequent Access (S3 One Zone-IA)

Here's why:

Cost-effectiveness: S3 One Zone-IA offers the lowest storage cost per gigabyte among the listed options, making it ideal for infrequently accessed data.

12-hour retrieval: Meets the company's retrieval time requirement of 12 hours, with an average retrieval time of 3.5 hours and a maximum of 12 hours.

Availability: Stores data in a single Availability Zone, which reduces costs compared to multi-AZ options like S3 Standard-IA. However, remember that data in a single AZ is susceptible to complete loss if that AZ experiences an outage.

upvoted 2 times

BigMF 1 year, 11 months ago

The Correct Answer is B: S3 One Zone-IA (Infrequent Access) costs \$0.01/GB whereas S3 Glacier Flexible costs \$0.0036/GB. See:

A company wants to create Amazon QuickSight dashboards every week by using its billing data.

Which AWS feature or tool can the company use to meet these requirements?

- A. AWS Budgets
- B. AWS Cost Explorer
- C. AWS Cost and Usage Report
- D. AWS Cost Anomaly Detection

Reveal Solution

Correct Answer: C

Community vote distribution

C (100%)

Discussion:

petercorn **Highly Voted** 2 years ago

Selected Answer: C

How Cost and Usage Reports work

After you create a Cost and Usage Report, AWS sends your report to the Amazon S3 bucket that you specify. AWS updates your report at least once a day until your charges are finalized.

Your report files consist of a .csv file or a collection of .csv files and a manifest file. You can choose to configure your report data for integration with Amazon Athena, Amazon Redshift, or Amazon QuickSight.

Selected Answer: B

B. Use tags to organize the resources. Activate cost allocation tags to track AWS costs on a detailed level.

upvoted 1 times

Lomtom 1 year, 9 months ago

Per Robot:

To effectively organize resources and track AWS costs based on business department, environment, and application, the most suitable solution is

B. Use tags to organize the resources and activate cost allocation tags.

Here's why:

Tags for Cost Allocation:

Tags allow you to label your AWS resources with metadata.

By assigning relevant tags (such as department, environment, or application) to your resources, you can categorize them effectively.

Cost allocation tags specifically help you track costs at a detailed level by associating costs with specific tags.

For example, you can tag resources with labels like "Marketing," "Development," "Production," etc.

AWS then aggregates costs based on these tags, providing granular insights into spending patterns.

This approach allows you to allocate costs accurately and understand which departments, projects, or applications are consuming resources and incurring costs.

Elastic Load Balancing automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in one or more Availability Zones. It monitors the health of its registered targets, and routes traffic only to the healthy targets

Elastic Load Balancing supports the following load balancers: Application Load Balancers, Network Load Balancers, Gateway Load Balancers, and Classic Load Balancers.

The load balancer distributes incoming application traffic across multiple targets, such as EC2 instances, in multiple Availability Zones. This increases the availability of your application.

Tricky question: What service allows users to model and PROVISION AWS resources? *sigh*

CDK models app infrastructure using typescript, Python Have, etc. But it uses

CloudFormation to provision. I choose A Pikachu!

Choose your answer based on how you decode the questions. I wish they were straight-up questions so we could answer them without taking an extra English course.

upvoted 4 times

d675329 1 year, 8 months ago

Selected Answer: C

AWS Cloud Development Kit (AWS CDK) lets one use Java, TypeScript etc. to model and provision instead of using plain CloudFormation templates which need YAML for configuration. Since the question clearly mentions programming languages, the answer is undoubtedly C.

upvoted 3 times

chalaka 1 year, 8 months ago

Selected Answer: C

C. AWS Cloud Development Kit (AWS CDK)

AWS CDK is a software development framework for defining cloud infrastructure in code and provisioning it through AWS CloudFormation. It allows developers to define cloud resources using familiar programming languages like TypeScript, Python, Java, and C#. This enables infrastructure to be defined, provisioned, and managed using the same software development practices and tools used for application code.

upvoted 2 times

Eleftheria 1 year, 9 months ago

Selected Answer: A

I think that is clear from the below text, that the model & provision option is covered by Cloud Formation:

"The AWS Cloud Development Kit (AWS CDK) is an open-source software development framework for defining cloud infrastructure in code and provisioning it through AWS CloudFormation."

upvoted 2 times

P0wned 1 year, 9 months ago

Selected Answer: C

AWS Cloud Development Kit (AWS CDK) lets users define cloud infrastructure using programming languages like TypeScript, Python, Java, and C#. It simplifies provisioning AWS resources by enabling developers to write infrastructure as code (IaC) in familiar languages, making it easier to manage and automate deployments.

upvoted 3 times

its_tima 1 year, 4 months ago

Here was Quizlet's answer:

"AWS CloudFormation provides a common language for you to describe and provision all the infrastructure resources in your cloud environment. CloudFormation allows you to use a simple text file to model and provision, in an automated and secure manner, all the resources needed for your applications across all regions and accounts. This file serves as the single source of truth for your cloud environment."

upvoted 1 times

517d694 1 year, 10 months ago

Selected Answer: A

CDK is great to model Apps, but you still need to Provision them through CloudFormation. The question is which service can both model AND provision, so in my opinion the answer is CloudFormation. which not only allows users to model AWS resources using YAML or JSON templates but also handles the provisioning and management of those resources in an automated and consistent manner. While AWS CDK offers a higher-level abstraction and allows users to model resources using programming languages, the actual provisioning is orchestrated by CloudFormation based on the generated templates.

Source: <https://docs.aws.amazon.com/cdk/v2/guide/home.html>

The AWS Cloud Development Kit (AWS CDK) is an open-source software development framework for defining cloud infrastructure in code and provisioning it through AWS CloudFormation.

upvoted 2 times

petercorn 2 years, 1 month ago

The AWS CDK lets you build reliable, scalable, cost-effective applications in the cloud with the considerable expressive power of a programming language

upvoted 1 times

ShaiTay 1 year, 2 months ago

Selected Answer: D

D. Spot Instances
upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: D

D. Spot Instances.
The Amazon EC2 instance pricing model that can provide discounts of up to 90% is the "Spot Instances" pricing model. With Spot Instances, you can bid for unused EC2 capacity, and if your bid price exceeds the current Spot price, your instances will be terminated. This model allows you to take advantage of unused capacity at significantly reduced prices compared to On-Demand instances. However, it comes with the caveat that your instances may be terminated if the Spot price increases above your bid price.
upvoted 1 times

A company has teams that have different job roles and responsibilities. The company's employees often change teams. The company needs to manage permissions for the employees so that the permissions are appropriate for the job responsibilities.

Which IAM resource should the company use to meet this requirement with the LEAST operational overhead?

- A. IAM user groups
- B. IAM roles
- C. IAM instance profiles
- D. IAM policies for individual users

Reveal Solution

Correct Answer: B

Community vote distribution

B (52%)

A (48%)

Discussion:

Rinkans **Highly Voted** 2 years, 1 month ago

Selected Answer: A

IAM user groups allow you to group users with similar job roles or responsibilities together. Instead of managing individual user permissions, you can assign IAM policies to these groups. When an employee changes teams or job roles, you can simply add or remove them from relevant user groups, and the permissions associated with the group will be applied automatically to the user.

upvoted 14 times

f964633 1 year, 6 months ago

IAM user groups can help manage permissions for users with similar responsibilities. However, as employees change teams and job roles, the need to constantly update group memberships can create operational overhead.

upvoted 3 times

saltheshash **Highly Voted** 2 years, 1 month ago

Selected Answer: B

IAM roles are the most suitable resource for managing permissions in a scenario where employees frequently change teams and have different job roles and responsibilities. IAM roles allow you to define a set of permissions and policies and then assign those roles to users or AWS services as needed. This way, you can grant temporary access based on the user's current job responsibilities, and the users do not have to be directly assigned specific permissions.

IAM user groups (option A) are typically used to simplify the management of permissions for sets of users who share common job responsibilities. However, roles provide more flexibility in dynamic scenarios where users move between teams.

Selected Answer: A

IAM roles are great for granting temporary permissions or cross-account access, they are not meant for day-to-day management of user permissions directly.

upvoted 1 times

ShaiTay 1 year, 2 months ago

Selected Answer: A

A. IAM User Groups - allows you to assign users to groups based on their job role. Then you can assign specific permissions to that group and modify as needed. If the user changes job roles, simply move them to a different group.

upvoted 1 times

veljkosbbb 1 year, 4 months ago

Selected Answer: A

A

IAM user groups allow you to organize users based on job roles or teams and assign common permissions to all members of the group. This minimizes operational overhead because you only need to manage permissions at the group level.

When employees change teams, you simply move them from one group to another. The permissions attached to the groups (via IAM roles or policies) automatically apply to the users.

upvoted 1 times

trev 1 year, 7 months ago

Selected Answer: A

Users: End User (Think People).

Groups: A collection of users under one set of permissions (permission as policy). As per IAM standards we create groups with permissions and then assign user to that group.

Role: you create roles and assign them to AWS resource (AWS resource example can be a customer, supplier, contractor, employee, an EC2 instance, some external application outside AWS) but remember you can't assign role to user.

upvoted 1 times

geocis 1 year, 7 months ago

Selected Answer: A

IAM User groups make more sense. The company has teams or "Groups" with different job roles, and often, employees jump to other teams. They want to know which will have the least operational overhead. Changing a user to a different group will grant them that team's current access.

upvoted 1 times

b0nb0n101 1 year, 8 months ago

The correct answer is:

B. IAM roles

Explanation: IAM roles allow you to delegate permissions that determine what the identity can and cannot do in AWS. You can use roles to delegate permissions to users, applications, or services that don't normally have access to your AWS resources. By using IAM roles, the company can easily manage permissions even when employees change teams, reducing operational overhead.

upvoted 1 times

Thaluu 1 year, 8 months ago

IAM user roles are used to group users with the same role, note the keyword here is "different roles" so the answer is B

upvoted 1 times

Thaluu 1 year, 8 months ago

sorry I made a mistake, IAM user groups in AWS is used to group users that have the same job role, so the answer is B

upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: B

B. IAM roles.

IAM roles are designed for granting temporary access to users or applications. They can be assigned to IAM users or AWS services, and permissions are assigned to the role rather than individual users. This means that when an employee changes teams, you can simply assign them a different role with the appropriate permissions for their new responsibilities, without having to modify individual user permissions or create new user groups. This flexibility reduces operational overhead.

upvoted 2 times

517d694 1 year, 10 months ago

Selected Answer: A

IAM User Groups is the correct answer.

IAM Roles are intended to be assumable by anyone who needs it. Also, a role does not have standard long-term credentials such as a password or access keys associated with it. Instead, when you assume a role, it provides you with temporary security credentials for your role session.

You can use roles to delegate access to users, applications, or services that don't normally have access to your AWS resources. We want these users to normally have access to the resources that fit their current job description, hence why IAM Groups are better.

IAM Groups:

An IAM user group is a collection of IAM users. User groups let you specify permissions for multiple users, which can make it easier to manage the

permissions for those users.

Which encryption types can be used to protect objects at rest in Amazon S3? (Choose two.)

- A. Server-side encryption with Amazon S3 managed encryption keys (SSE-S3)
- B. Server-side encryption with AWS KMS managed keys (SSE-KMS)
- C. TLS
- D. SSL
- E. Transparent Data Encryption (TDE)

Reveal Solution

Correct Answer: AB

Community vote distribution

AB (80%)

AE (20%)

Discussion:

1507a4f 5 months, 2 weeks ago

Selected Answer: AB

The correct answers are:

- A. Server-side encryption with Amazon S3 managed encryption keys (SSE-S3) ✓
- B. Server-side encryption with AWS KMS managed keys (SSE-KMS) ✓

Reasoning:

SSE-S3 uses keys managed by Amazon S3 to encrypt your data at rest.

SSE-KMS integrates with AWS Key Management Service (KMS) for more control over encryption keys, including key rotation and access policies.

TLS and SSL are used for data in transit, not at rest.

Transparent Data Encryption (TDE) is used with databases like Amazon RDS for Oracle or SQL Server, not for S3 objects.

Confidence level: High

Reference: AWS S3 Encryption Documentation

upvoted 1 times

Gustavo_Arg 7 months ago

Selected Answer: AE

A. Server-side encryption with Amazon S3 managed encryption keys (SSE-S3)

All Amazon S3 buckets have encryption configured by default, and all new objects that are uploaded to an S3 bucket are automatically encrypted at rest. Server-side encryption with Amazon S3 managed keys (SSE-S3) is the default encryption configuration for every bucket in Amazon S3.

E. Transparent Data Encryption (TDE) is a technology used to encrypt entire databases at rest, including data and log files, to protect against unauthorized access to sensitive data.

upvoted 1 times

chalaka 1 year, 3 months ago

Selected Answer: AB

The encryption types that can be used to protect objects at rest in Amazon S3 are:

- A. Server-side encryption with Amazon S3 managed encryption keys (SSE-S3)
- B. Server-side encryption with AWS KMS managed keys (SSE-KMS)

These options provide encryption for data stored in Amazon S3. SSE-S3 and SSE-KMS encrypt data at the object level using encryption keys managed by Amazon S3 and AWS Key Management Service (KMS), respectively.

upvoted 2 times

Ionesia 1 year, 7 months ago

Selected Answer: AB

SSE S3/KMS correct answer

upvoted 1 times

Syedharoonhussain 1 year, 8 months ago

Amazon S3 now applies server-side encryption with Amazon S3 managed keys (SSE-S3) as the base level of encryption for every bucket in Amazon S3. Starting January 5, 2023, all new object uploads to Amazon S3 are automatically encrypted at no additional cost and with no impact on performance. T

Unless you specify otherwise, buckets use SSE-S3 by default to encrypt objects. However, you can choose to configure buckets to use server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS) instead.

BenRowsey 6 months, 1 week ago

thats wrong

upvoted 1 times

ChhatwaniB 1 year, 6 months ago

Selected Answer: B

EC2 usage is billed in one-second increments, with a minimum of 60 seconds.

upvoted 1 times

f964633 1 year, 6 months ago

Selected Answer: B

The customer was running the EC2 instance for 3 hours, 5 minutes, and 6 seconds. Amazon bills for EC2 instances in one-second increments, so the customer will be billed for the full duration of 3 hours, 5 minutes, and 6 seconds.

Option A (3 hours, 5 minutes) is incorrect because it does not include the 6 seconds.

Option C (3 hours, 6 minutes) is incorrect because it rounds up the minutes incorrectly.

Option D (4 hours) is incorrect because it rounds up the time too much.

upvoted 1 times

b0nb0n101 1 year, 8 months ago

The correct answer is:

C. 3 hours, 6 minutes

Explanation: Amazon EC2 is billed on an hourly basis, but it uses per-second billing with a minimum of 60 seconds. If an instance runs for any part

of a minute, you are billed for that full minute. So, if an instance runs for 3 hours, 5 minutes, and 6 seconds, you will be billed for 3 hours and 6 minutes.

upvoted 3 times

d675329 1 year, 8 months ago

Selected Answer: B

This is from the AWS documentation for On-Demand instance pricing

Pricing is per instance-hour consumed for each instance, from the time an instance is launched until it is terminated or stopped. Each partial instance-hour consumed will be billed per-second for Linux, Windows, Windows with SQL Enterprise, Windows with SQL Standard, and Windows with SQL Web Instances, and as a full hour for all other instance types.

<https://aws.amazon.com/ec2/pricing/on-demand/>

Since OS is Amazon Linux, billing is per second (granularity of billing is at the seconds level, whereas prices are mentioned per hour)

upvoted 2 times

Thaluu 1 year, 8 months ago

C. 3 hours, 6 minutes

Amazon EC2 instances are billed for their running time, rounded up to the next full minute. So if an instance runs for any part of a minute, you will be billed for the full minute. In this case, the instance ran for 3 hours, 5 minutes, and 6 seconds, so the customer will be billed for 3 hours and 6 minutes.

upvoted 3 times

chalaka 1 year, 8 months ago

Selected Answer: C

Given that Amazon charges a minimum of 60 seconds and then charges the exact time of use, we can calculate the billing accordingly.

The customer ran the Amazon EC2 instance for 3 hours, 5 minutes, and 6 seconds.

The billing would be rounded up to the nearest 60-second increment for the first 60 seconds, and then billed for the exact time of use beyond that.

So, the customer would be billed for 3 hours and 6 minutes, as the 6 seconds would be rounded up to 1 minute.

Therefore, the correct answer remains:

C. 3 hours, 6 minutes.

upvoted 4 times

chalaka 1 year, 9 months ago

B. Amazon Macie

Amazon Macie is specifically designed to help discover, classify, and protect sensitive data stored in AWS. It uses machine learning and pattern matching to automatically identify and classify sensitive data within various AWS services like S3 buckets, helping companies better understand their data and enforce security policies.

upvoted 2 times

A user has a stateful workload that will run on Amazon EC2 for the next 3 years.

What is the MOST cost-effective pricing model for this workload?

- A. On-Demand Instances
- B. Reserved Instances
- C. Dedicated Instances
- D. Spot Instances

Reveal Solution

Correct Answer: B

Community vote distribution

B (100%)

Discussion:

chalaka 1 year, 3 months ago

Selected Answer: B

B. Reserved Instances.

Reserved Instances (RIs) allow you to commit to a specific instance type in a specific AWS region for a term of 1 or 3 years, in exchange for a significant discount compared to On-Demand pricing. Since the workload is expected to run continuously for 3 years, committing to Reserved Instances would provide the most cost savings over the long term.

upvoted 1 times

64a61e7 1 year, 7 months ago

Who enables encryption of data at rest for Amazon Elastic Block Store (Amazon EBS)?

- A. AWS Support
- B. AWS customers
- C. AWS Key Management Service (AWS KMS)
- D. AWS Trusted Advisor

Reveal Solution

Correct Answer: B

Community vote distribution

B (78%)

C (22%)

Discussion:

peable Highly Voted 2 years, 1 month ago

Selected Answer: B

Not sure, but going for B: While AWS KMS does the encryption on a technical level, the customer needs to initiate the configuration in AWS KMS to do the encryption?! Otherwise, there wouldn't be unencrypted devices. Found this "You can enable encryption automatically on all new EBS volumes and snapshot copies in your AWS account and Region." This "you" is the customer... semantics, I know. Still going for B.

<https://docs.aws.amazon.com/kms/latest/developerguide/services-ebs.html>

upvoted 8 times

blehbleh Highly Voted 2 years ago

Selected Answer: B

The answer is B. The customer has to select AWS KMS. If the customer does not explicit select it then nothing will be encrypted. The question asks "who enables encryption" not what is used to encrypt. Therefore, since the user has to enable the service the answer should be B the user.

upvoted 6 times

Mark_DeSade Most Recent 1 year, 1 month ago

Selected Answer: B

Open the Amazon EC2 console at
 Select the Region from the navigation bar
 Select EC2 Dashboard from the navigation pane
 Choose Account Attributes, then Data protection and security in the upper-right corner
 In the EBS encryption section, choose Manage
 Select Enable for Always encrypt new EBS volumes
 Choose a default encryption key
 Select Update EBS encryption

upvoted 2 times

ShaiTay 1 year, 2 months ago

B. AWS customers

upvoted 1 times

f964633 1 year, 6 months ago

Selected Answer: C

A. AWS Support - AWS Support does not directly enable encryption for EBS. They provide support and guidance, but the customer or AWS KMS is responsible for enabling encryption.

B. AWS customers - AWS customers are responsible for enabling encryption for their EBS volumes, but they do so using AWS KMS.

C. AWS Key Management Service (AWS KMS) - AWS KMS is the service that provides the encryption keys and enables encryption of data at rest for Amazon EBS. Customers can use AWS KMS to create, manage, and use cryptographic keys to protect their data.

D. AWS Trusted Advisor - AWS Trusted Advisor is a service that provides recommendations to optimize your AWS environment, but it does not directly enable encryption for EBS volumes.

So, the correct answer is option C. AWS Key Management Service (AWS KMS) enables encryption of data at rest for Amazon Elastic Block Store (Amazon EBS).

upvoted 2 times

geocis 1 year, 7 months ago

Selected Answer: B

Who refers to a person but can also refer to a non-person, which depends on context and grammar usage.

I'll go with B.) AWS Customer

Data at rest is not enabled by default, which would require the customer's interaction to make it so. That's my logic for the question.

upvoted 1 times

BShelat 2 years ago

Selected Answer: B

<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSEncryption.html>

If customer selects/uses AWS KMS key for EBS encryption then KMS key policy allows any user with with access to the required AWS KMS actions to use this KMS key to encrypt or decrypt EBS resources. So answer is B.

upvoted 2 times

VikJo1978 2 years, 1 month ago

According to the official documentation, when you create an encrypted EBS volume and attach it to a supported instance type, data stored at rest on the volume, disk I/O, and snapshots created from the volume are all encrypted. The encryption occurs on the servers that host EC2 instances, providing encryption of data-in-transit from EC2 instances to EBS storage 1.

The encryption is performed using AWS Key Management Service (AWS KMS) keys when creating encrypted volumes and snapshots. The data key is generated by AWS KMS and then encrypted by AWS KMS with your AWS KMS key prior to being stored with your volume information. All snapshots, and any subsequent volumes created from those snapshots using the same AWS KMS key share the same data key 2.

Therefore, the correct answer is C. AWS Key Management Service (AWS KMS).

A company wants to migrate its PostgreSQL database to AWS. The company does not use the database frequently.

Which AWS service or resource will meet these requirements with the LEAST management overhead?

- A. PostgreSQL on Amazon EC2
- B. Amazon RDS for PostgreSQL
- C. Amazon Aurora PostgreSQL-Compatible Edition
- D. Amazon Aurora Serverless

Reveal Solution

Correct Answer: D

Community vote distribution

D (71%)

B (25%)

4%

Discussion:

VikJo1978 Highly Voted 2 years, 1 month ago

Selected Answer: D

If cost is not a concern and you want the least management overhead, Amazon Aurora Serverless would be the best option. Amazon Aurora Serverless provides the highest level of automation and scalability as it is a serverless database solution. You don't have to worry about managing database instances, scaling, or maintenance. The database automatically scales up and down to meet your application's requirements, and you only pay for the resources you actually use.

So, the correct answer in this case would be:

D. Amazon Aurora Serverless

upvoted 8 times

its_tima Most Recent 1 year ago

Selected Answer: D

Amazon Aurora Serverless - automatically starts up, shuts down, and scales capacity up or down based on your application's needs, thus, reducing management overhead.*

Amazon Aurora PostgreSQL-Compatible Edition - a simple and cost-effective to set up, operate, and scale your new and existing PostgreSQL deployments.

Amazon RDS for PostgreSQL - deploy scalable PostgreSQL deployments in minutes with cost-efficient and resizable hardware capacity.

upvoted 1 times

Oezge 1 year, 1 month ago

Selected Answer: D

Amazon Aurora Serverless is a fully managed database service that automatically adjusts capacity based on the workload. It is specifically designed for use cases where the database is not used frequently or has variable workloads. With Aurora Serverless, you only pay for the database capacity that you use, and it automatically scales up and down as needed. This makes it a great fit for applications with unpredictable or infrequent usage.

upvoted 1 times

ShaiTay 1 year, 2 months ago

Selected Answer: D

D. Amazon Aurora Serverless - cost effective, automatic scaling, low management overhead

upvoted 1 times

moadabdou 1 year, 7 months ago

Selected Answer: D

The correct answer is:

D. Amazon Aurora Serverless

Explanation: Amazon Aurora Serverless is the best choice for this company as it offers minimal resource management and automatically scales based on demand. With Aurora Serverless, there is no need to provision or manually manage database instances. Instead, Aurora Serverless adjusts automatically based on the incoming query volume. This significantly reduces administrative overhead for the company while providing a scalable solution for its database infrastructure.

upvoted 2 times

chalaka 1 year, 9 months ago

Selected Answer: D

D. Amazon Aurora Serverless.

Amazon Aurora Serverless is a fully managed relational database service that automatically scales compute capacity up or down based on the application's needs. It is ideal for workloads with unpredictable or intermittent usage patterns, as it automatically starts and stops database instances based on demand. This means the company doesn't need to provision or manage the database instance themselves, resulting in minimal management overhead. Additionally, Aurora Serverless offers the benefits of Aurora's high performance and durability, making it a suitable choice for migrating the PostgreSQL database with minimal management effort.

upvoted 2 times

517d694 1 year, 10 months ago

Selected Answer: D

The answer is D.

Aurora Serverless can handle resource capacity more flexibly, thus being less overhead to manage

. In Amazon RDS, a deployed database server is not scaled to a larger instance type unless its configuration is explicitly updated to a different size, which can result in up to five minutes of downtime. RDS does offer auto scaling for read replicas, but the process takes a few minutes to execute since it has to deploy additional RDS instances. Aurora Serverless' automatic scaling results in much faster deployment times, typically within 30 seconds.

upvoted 1 times

Hommedollars 1 year, 11 months ago

Selected Answer: B

Answer is B

From ChatGPT:

For a company that wants to migrate its PostgreSQL database to AWS with minimal management overhead, Amazon RDS (Relational Database Service) is a suitable solution. Amazon RDS takes care of routine database tasks such as backups, patch management, and scaling, allowing you to focus on your application instead of the underlying database infrastructure.

upvoted 3 times

stoy123 1 year, 11 months ago

Selected Answer: C

Sorry it's C:

Amazon Aurora PostgreSQL:

Pros:

Fully managed service with automatic patching, backups, and replication.

High availability and scalability.

Pay-per-second billing minimizes costs for infrequent use.

Supports homogeneous migrations from existing PostgreSQL databases.

Cons:

Might have higher base costs compared to other options for infrequent use.

Less customization compared to self-managed options.

A company is migrating to the AWS Cloud and plans to run experimental workloads for 3 to 6 months on AWS.

Which pricing model will meet these requirements?

- A. Use Savings Plans for a 3-year term.
- B. Use Dedicated Hosts.
- C. Buy Reserved Instances.
- D. Use On-Demand Instances.

Reveal Solution

Correct Answer: D

Community vote distribution

D (100%)

Discussion:

chalaka 1 year, 3 months ago

Selected Answer: D

D. Use On-Demand Instances.

On-Demand Instances provide flexibility and require no upfront commitment. You pay for the compute capacity by the hour or by the second, with no long-term contracts or upfront payments. This model is ideal for short-term workloads, experimental projects, or situations where the workload's duration is uncertain. It allows you to scale up or down as needed without any commitments, making it the most appropriate choice for the company's requirements.

upvoted 2 times

sdale 1 year, 6 months ago

Selected Answer: D

I think D is correct, because the company requires short-term but continuous computing resources.

upvoted 4 times

A company that has AWS Enterprise Support is launching a new version of a popular product in 2 months. The company expects a large increase in traffic to its website. The website is hosted on Amazon EC2 instances.

Which action should the company take to assess its readiness to scale for this launch?

- A. Replace the EC2 instances with AWS Lambda functions.
- B. Use AWS Infrastructure Event Management (IEM) support.
- C. Submit a request on AWS Marketplace to monitor the event.
- D. Review the coverage reports in the AWS Cost Management console.

Reveal Solution

Correct Answer: B

Community vote distribution

Discussion:

ShaiTay 1 year, 2 months ago

Selected Answer: B

B. Use AWS Infrastructure Event Management (IEM) support. This is offered to Enterprise Support customers to help plan for big changes
upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: B

B. Use AWS Infrastructure Event Management (IEM) support.

AWS Infrastructure Event Management (IEM) support helps customers prepare for and respond to events that could impact their AWS infrastructure, such as product launches or traffic spikes. It provides proactive guidance, best practices, and recommendations tailored to the company's specific situation and requirements. By leveraging IEM support, the company can ensure that its AWS infrastructure is properly configured, optimized, and ready to handle the anticipated increase in website traffic.

A is correct

upvoted 1 times

ShaiTay 1 year, 2 months ago

Selected Answer: A

A. Use AWS Organizations and create one account for each business unit. - AWS Organizations allows you to organize all accounts under one master/management account. Then you can easily track costs.

upvoted 1 times

chalaka 1 year, 8 months ago

Selected Answer: A

A. Use AWS Organizations and create one account for each business unit.

AWS Organizations allows you to centrally manage and govern multiple AWS accounts. By creating separate AWS accounts for each business unit, the company can easily separate and track costs for each unit. AWS provides consolidated billing, which aggregates the charges for all linked accounts in a single bill while still allowing detailed cost reporting at the account level. This approach provides a clean separation of costs for each business unit with minimal operational overhead.

upvoted 1 times

517d694 1 year, 10 months ago

Selected Answer: A

A.

The least overhead is just having an account per BU. Otherwise you need to assign owners, work with tags, and have a billing structure you need to maintain.

upvoted 2 times

Felicia_T 1 year, 10 months ago

Selected Answer: A

A. Use AWS Organizations and create one account for each business unit.

upvoted 2 times

Dutch_delight 1 year, 11 months ago

I really think it should be D. Because google bard says:

Therefore, considering the trade-off between functionality and operational overhead, D. Using the AWS Billing console with owners is the solution with the LEAST operational overhead. It offers a balance between ease of use and cost separation while avoiding the significant management overhead of separate accounts or custom solutions like spreadsheets or DynamoDB tables.

upvoted 1 times

komorebi 1 year, 11 months ago

Selected Answer: A

ChatGPT Answer

The most suitable solution that meets the requirements with the least operational overhead is:

A. Use AWS Organizations and create one account for each business unit.

Using AWS Organizations allows you to centrally manage and govern multiple AWS accounts. By creating separate accounts for each business unit, you can easily isolate and track costs for each unit without mixing them up. This approach provides a clear separation of resources and costs, simplifying cost management and tracking. Additionally, AWS provides consolidated billing and cost allocation features within Organizations, making it easier to manage billing and costs across multiple accounts.

upvoted 3 times

JackHerer 1 year, 11 months ago

Selected Answer: D

This is the answer from AI.

D. Use the AWS Billing console to assign owners to resources and track costs.

Here's why the other options might not be optimal:

A. Use AWS Organizations and create one account for each business unit: This approach provides strong isolation but significantly increases management complexity and overhead due to managing multiple separate accounts.

B. Use a spreadsheet to control the owners and cost of each resource: This is a manual and error-prone method, not scalable for multiple workloads and business units, and prone to human error.

C. Use an Amazon DynamoDB table to record costs for each business unit: While offering flexibility, setting up and maintaining a DynamoDB table adds unnecessary complexity and overhead compared to built-in tools.

upvoted 2 times

A company wants a time-series database service that makes it easier to store and analyze trillions of events each day.

Which AWS service will meet this requirement?

Which option is a shared control between AWS and the customer, according to the AWS shared responsibility model?

- A. Configuration management
- B. Physical and environmental controls
- C. Data integrity authentication
- D. Identity and access management

Reveal Solution

Correct Answer: A

Community vote distribution

A (100%)

Discussion:

Kilobay1 1 year, 4 months ago

Selected Answer: A

remember AWS is responsible for everything of the cloud and the customer is responsible for everything in the cloud so A and D could be correct if this were a two part answer question but A is the best for the real exam.

upvoted 3 times

Thaluu 1 year, 8 months ago

A. Configuration management

In the AWS shared responsibility model, configuration management is a shared control. AWS is responsible for the infrastructure's configuration management, including the configuration of the hardware, software, networking, and facilities that run AWS services.

On the other hand, the customer is responsible for configuration management at the application level, including the security configuration of AWS provided services such as Amazon EC2 instances, Amazon S3 buckets, and Amazon DynamoDB tables.

So, both AWS and the customer have responsibilities when it comes to configuration management, making it a shared control.

upvoted 3 times

Thaluu 1 year, 8 months ago

BUT even IAM is correct too.

For Configuration Management, AWS is responsible for the infrastructure's configuration management, while the customer is responsible for their own application-level configuration management.

For IAM, AWS is responsible for the security and availability of the IAM service itself, while the customer is responsible for managing their IAM users, groups, roles, and policies.

ChhatwaniB 1 year, 6 months ago

Selected Answer: D

Standard Reserved Instances typically provide the highest discount levels.
upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: D

D. Standard Reserved Instances

Reserved Instances offer significant cost savings compared to On-Demand Instances, especially for workloads that are expected to run continuously for a long duration, such as a database server for a 1-year project. Standard Reserved Instances provide a discount on the hourly charge for the instance compared to On-Demand pricing, in exchange for committing to a one- or three-year term.

Convertible Reserved Instances offer similar savings but provide more flexibility to change the instance type, operating system, or tenancy during the term. However, they may have a slightly higher cost compared to Standard Reserved Instances due to this flexibility.
upvoted 3 times

goldentugboat 1 year, 9 months ago

Selected Answer: D

From the docs:

Standard Reserved Instance enables you to modify Availability Zone, scope, networking type, and instance size (within the same instance type) of your Reserved Instance.

Convertible Reserved Instance enables you to exchange one or more Convertible Reserved Instances for another Convertible Reserved Instance with a different configuration, including instance family, operating system, and tenancy.
upvoted 3 times

BigMF 1 year, 11 months ago

Selected Answer: B

I believe the Convertible Reserved instance is a better option because the key word is "right-sized". If you choose a Standard Reserved instance, you cannot change it and may be paying for more resources than you need. Whereas, with Convertible instances, you can start small and scale up if needed.

upvoted 2 times

BShelat 2 years ago

A company has a physical tape library to store data backups. The tape library is running out of space. The company needs to extend the tape library's capacity to the AWS Cloud.

Which AWS service should the company use to meet this requirement?

- A. Amazon Elastic File System (Amazon EFS)
- B. Amazon Elastic Block Store (Amazon EBS)
- C. Amazon S3
- D. AWS Storage Gateway

Reveal Solution

Correct Answer: D

Community vote distribution

D (100%)

Discussion:

petercorn Highly Voted 2 years ago

Selected Answer: D

AWS Storage Gateway connects an on-premises software appliance with cloud-based storage to provide seamless integration with data security features between your on-premises IT environment and the AWS storage infrastructure. You can use the service to store data in the Amazon Web Services Cloud for scalable and cost-effective storage that helps maintain data security.

AWS Storage Gateway offers file-based File Gateways (Amazon S3 File and Amazon FSx File), volume-based (Cached and Stored), and tape-based storage solutions.

A company is using the AWS Free Tier for several AWS services for an application.

What will happen if the Free Tier usage period expires or if the application use exceeds the Free Tier usage limits?

- A. The company will be charged the standard pay-as-you-go service rates for the usage that exceeds the Free Tier usage.
- B. AWS Support will contact the company to set up standard service charges.
- C. The company will be charged for the services it consumed during the Free Tier period, plus additional charges for service consumption after the Free Tier period.
- D. The company's AWS account will be frozen and can be restarted after a payment plan is established.

Selected Answer: C

C. Use Amazon CloudFront with the EC2 instances configured as the source.

upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: C

C. Use Amazon CloudFront with the EC2 instances configured as the source.

Amazon CloudFront is a content delivery network (CDN) service that distributes content globally with low latency and high transfer speeds by caching content at edge locations around the world. By configuring the EC2 instances as the origin source for CloudFront, static website content can be cached at edge locations, reducing the distance and latency for users accessing the website.

This approach leverages CloudFront's global network of edge locations to deliver content to users from the nearest edge location, thereby minimizing latency and improving the overall performance of the static website.

D. AWS Snowball Edge

upvoted 1 times

lirant 1 year, 3 months ago

Selected Answer: D

AWS Snowball Edge is a type of Snowball device with on-board storage and compute power for select AWS capabilities. Snowball Edge can process data locally, run edge-computing workloads, and transfer data to or from the AWS Cloud.

Each Snowball Edge device can transport data at speeds faster than the internet. This transport is done by shipping the data in the devices through a regional carrier. The appliances are rugged, complete with E Ink shipping labels.

Snowball Edge devices have three options for device configurations—Storage Optimized, Compute Optimized, and Compute Optimized with GPU. When this guide refers to Snowball Edge devices, it's referring to all options of the device. When specific information applies only to one or more optional configurations of devices (such as how the Snowball Edge with GPU has an on-board GPU), it is called out specifically.

D. Management of infrastructure is offloaded to AWS.

One of the benefits of using AWS serverless computing is that it offloads the management of infrastructure to AWS. With serverless computing, developers can focus on writing code without worrying about server provisioning, scaling, or maintenance. AWS takes care of the underlying infrastructure, allowing developers to concentrate on building and deploying applications.

One of the key benefits of using AWS serverless computing, such as AWS Lambda, is that the management of infrastructure is offloaded to AWS. In a serverless architecture, users can focus on writing code for their applications, and AWS automatically takes care of provisioning and managing the underlying infrastructure. This allows developers to concentrate on building and deploying applications without the need to worry about server provisioning, scaling, or maintenance.

To provide temporary security credentials for AWS users to access AWS services, the developer should use:

C. AWS Security Token Service (AWS STS)

AWS STS allows you to grant users and systems temporary access to AWS resources. Users can assume an IAM role for a limited time to access AWS services, which STS facilitates by providing temporary security credentials. This service is particularly useful in scenarios where you need to provide access that is limited in time and scope, such as for cross-account access or federated user access.

Selected Answer: C

Download the IAM credential report, then provide the report to the auditor.

upvoted 7 times

4462dfa Highly Voted 2 years ago

The simplest way to provide an external auditor with a list of all IAM users, including the status of users' credentials and access keys, is:

C. Download the IAM credential report, then provide the report to the auditor.

The IAM credential report is a feature within AWS Identity and Access Management (IAM) that provides a way to audit the status of credentials for all IAM users in an AWS account. It includes information about when each user's credentials were last used, the status of multi-factor authentication (MFA), and the status of access keys. This report can be generated and downloaded as a CSV file, making it easy to share with auditors or for compliance purposes.

Selected Answer: C

https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_getting-report.html

Getting credential reports (console)

You can use the AWS Management Console to download a credential report as a comma-separated values (CSV) file. To download a credential report (console) Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.

In the navigation pane, choose Credential report. Choose Download Report.

A. Allow access to an Amazon EC2 instance through only a specific port.

upvoted 1 times

BShelat 1 year, 6 months ago

Selected Answer: A

<https://docs.aws.amazon.com/vpc/latest/userguide/vpc-security-groups.html>

Security groups are stateful. For example, if you send a request from an instance, the response traffic for that request is allowed to reach the instance regardless of the inbound security group rules. Responses to allowed inbound traffic are allowed to leave the instance, regardless of the outbound rules. So "D" is NOT the answer. "A" is the correct answer.

upvoted 2 times

petercorn 1 year, 6 months ago

Selected Answer: A

<https://docs.aws.amazon.com/vpc/latest/userguide/vpc-security-groups.html>

upvoted 1 times

Aghajee 1 year, 6 months ago

A. Allow access to an Amazon EC2 instance through only a specific port.

Security groups in AWS are used to control inbound and outbound traffic to and from Amazon EC2 instances. They act as virtual firewalls for your instances. You can define rules in a security group to allow specific traffic based on protocols, ports, and IP address ranges. Therefore, using security groups, you can allow access to an Amazon EC2 instance through only a specific port, effectively controlling the traffic that is permitted.

Selected Answer: AD

- A. They are stateless.
 - D. They process rules in order, starting with the lowest numbered rule, when deciding whether to allow traffic.
- upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: AD

A. They are stateless: Network ACLs do not maintain connection state information. Each packet is evaluated independently based on the rules defined in the ACL.

D. They process rules in order, starting with the lowest numbered rule, when deciding whether to allow traffic: Network ACLs evaluate rules sequentially from the lowest numbered rule to the highest numbered rule. Once a rule that matches the traffic is found, further rule processing stops.

INSTANCE LEVEL IS SECURITY GROUP

upvoted 2 times

BShelat 2 years ago

Selected Answer: AD

<https://docs.aws.amazon.com/vpc/latest/userguide/vpc-network-acls.html>

upvoted 1 times

petercorn 2 years ago

Selected Answer: AD

Rule number. Rules are evaluated starting with the lowest numbered rule. As soon as a rule matches traffic, it's applied regardless of any higher-numbered rule that might contradict it.

NACLs are stateless, which means that information about previously sent or received traffic is not saved.

<https://docs.aws.amazon.com/vpc/latest/userguide/vpc-network-acls.html>

upvoted 3 times

Aghajee 2 years ago

- A. They are stateless.
- D. They process rules in order, starting with the lowest numbered rule, when deciding whether to allow traffic.

Explanation:

A. Network ACLs (Access Control Lists) in AWS are stateless, meaning they do not keep track of the state of established connections. Each rule in a network ACL is applied independently of the others.

D. Network ACLs process rules in order, starting with the lowest numbered rule. Once a rule is matched, no further rules are evaluated, which makes the order of rules important.

The other options are not correct.

upvoted 4 times

Tony_99_08 2 years ago

Which capabilities are in the platform perspective of the AWS Cloud Adoption Framework (AWS CAF)? (Choose two.)

- A. Performance and capacity management
- B. Data engineering
- C. Continuous integration and continuous delivery (CI/CD)
- D. Infrastructure protection
- E. Change and release management

Reveal Solution

Correct Answer: BC

Community vote distribution

Discussion:

chalaka **Highly Voted** 1 year, 9 months ago

Selected Answer: BC

B. Data engineering: This capability focuses on managing data pipelines, data storage, and data processing workflows to enable efficient data management and analytics in the cloud.

C. Continuous integration and continuous delivery (CI/CD): This capability involves implementing automated processes for building, testing, and deploying software applications in a continuous manner, ensuring faster delivery cycles and improved software quality.

<https://docs.aws.amazon.com/prescriptive-guidance/latest/aws-caf-platform-perspective/welcome.html>

upvoted 7 times

1507a4f **Most Recent** 5 months, 2 weeks ago

Selected Answer: AC

The correct answers are:

- A. Performance and capacity management ✓
- C. Continuous integration and continuous delivery (CI/CD) ✓

Reasoning:

In the Platform perspective of the AWS Cloud Adoption Framework (AWS CAF), the focus is on delivering and managing cloud workloads efficiently. This includes:

Performance and capacity management → Ensuring workloads meet performance needs and scale efficiently.

Continuous integration and continuous delivery (CI/CD) → Automating application build, test, and deployment pipelines.

Other options:

B. Data engineering → Falls under the Data perspective, not Platform.

D. Infrastructure protection → Falls under the Security perspective.

E. Change and release management → Falls under the Operations perspective.

Confidence level: High

Which Amazon S3 storage class is MOST cost-effective for unknown access patterns?

- A. S3 Standard
- B. S3 Standard-Infrequent Access (S3 Standard-IA)
- C. S3 One Zone-Infrequent Access (S3 One Zone-IA)
- D. S3 Intelligent-Tiering

Reveal Solution

Correct Answer: D

Community vote distribution

D (100%)

Discussion:

Mike1987 Highly Voted 2 years ago

Selected Answer: D

D. S3 Intelligent-Tiering

S3 Intelligent-Tiering is the most cost-effective option for unknown access patterns. It automatically moves objects between two access tiers (frequent and infrequent access) based on changing access patterns. This helps optimize costs for data with unknown or changing access patterns.

upvoted 10 times

Ashisohail Highly Voted 2 years ago

D

S3 Intelligent-Tiering is an Amazon S3 storage class that analyzes an AWS user's stored data and automatically moves it between storage tiers based on usage frequency. It is designed to optimize storage costs for data with irregular or unknown access patterns.

upvoted 5 times

tastatura Most Recent 9 months, 2 weeks ago

Selected Answer: D

A: S3 Standard – Good for frequent access, but not optimized for cost when access patterns are unknown or infrequent.

B: S3 Standard-IA – Lower cost for infrequent access, but incurs extra charges if data is accessed more than expected.

C: S3 One Zone-IA – Cheaper but stores data in one Availability Zone, making it less durable and not ideal for unpredictable patterns.

D: S3 Intelligent-Tiering , it's designed specifically for unknown or changing access patterns. It automatically moves data between frequent and infrequent access tiers based on usage, optimizing cost without performance loss.

upvoted 1 times

Kilobay1 1 year, 4 months ago

Selected Answer: D

S3 Intelligent-Tiering: This storage class is designed to optimize costs for data with unknown or changing access patterns. It automatically moves objects between two access tiers (frequent and infrequent access) based on changing access patterns, without any operational overhead. This makes it ideal for data whose access patterns are not predictable.

Answer should be : AWS Marketplace

upvoted 2 times

Jay_K 2 years ago

Selected Answer: C

The correct answer is C. AWS Marketplace.

Here's why AWS Marketplace is the most suitable option for running a pre-installed third-party firewall on an EC2 instance:

AWS Marketplace provides a wide range of pre-configured software solutions, including firewalls, that can be quickly deployed on EC2 instances. This eliminates the need for manual installation and configuration, saving time and effort.

upvoted 2 times

Which AWS Cloud benefit gives a company the ability to quickly deploy cloud resources to access compute, storage, and database infrastructures in a matter of minutes?

- A. Elasticity
- B. Cost savings
- C. Agility
- D. Reliability

Reveal Solution

Correct Answer: C

Community vote distribution

C (100%)

Discussion:

tastatura 9 months, 2 weeks ago

Selected Answer: C

A: Elasticity – Refers to automatically scaling resources up or down based on demand, not the speed of initial deployment.

B: Cost savings – Refers to reduced capital expenditure and pay-as-you-go pricing, not deployment speed.

C: Agility – agility is the AWS Cloud benefit that allows companies to quickly deploy and experiment with resources like compute, storage, and databases in minutes.

D: Reliability – Refers to the ability of the system to recover from failures and remain available, not to deployment speed.

A: AWS CLI

upvoted 1 times

Mike1987 1 year, 6 months ago

Selected Answer: A

The AWS CLI is a command-line tool provided by AWS that allows developers and administrators to interact with AWS services directly from the command line.

It provides a set of commands for a broad set of AWS services, allowing users to perform tasks such as creating and managing EC2 instances, configuring S3 buckets, managing IAM users, and more.

Developers can use scripts and automation tools to orchestrate and automate various AWS operations by leveraging the AWS CLI commands.

upvoted 2 times

Ashisohail 1 year, 6 months ago

A

The AWS Command Line Interface (AWS CLI) is a unified tool to manage your AWS services. With just one tool to download and configure, you can control multiple AWS services from the command line and automate them through scripts.

Selected Answer: B

Answer is B: Cloudformation.

<https://docs.aws.amazon.com/whitepapers/latest/development-and-test-on-aws/testing-phase.html>

Provisioning complete environments

While you can create complex test environments containing multiple instances using the AWS APIs, command line tools, or the AWS Management Console, AWS CloudFormation makes it even easier to create a collection of related AWS resources and provision them in an orderly and predictable fashion.

AWS CloudFormation uses templates to create and delete a collection of resources together as a single unit (a stack). A complete test environment running on AWS can be described in a template, which is a text file in JSON or YAML format.

Selected Answer: C

Amazon Comprehend (Option C): Amazon Comprehend is a natural language processing (NLP) service that can be used to analyze and extract insights from text. It provides capabilities such as sentiment analysis, key phrase extraction, entity recognition, and language detection. In the context of a library wanting to automate the classification of electronic books based on their contents, Amazon Comprehend could be used to analyze the text content of the books and extract relevant information for classification purposes.

<https://docs.aws.amazon.com/wellarchitected/latest/operational-excellence-pillar/operational-excellence.html>

upvoted 1 times

Aghajee 1 year, 6 months ago

The design principle of updating components regularly and making changes in small, reversible increments aligns with the pillar of:

C. Operational Excellence

Operational excellence in the AWS Well-Architected Framework focuses on designing and operating workloads to deliver business value, with a strong emphasis on continuous improvement, responding to events, and automation. Making regular updates in small, reversible increments supports the goal of achieving operational excellence by promoting agility and efficiency in the development and deployment processes.

upvoted 2 times

StevenNGUYEN 1 year, 6 months ago

Selected Answer: C

Operational Excellence: Focus on creating applications that effectively support production workload.

- Plan for and anticipate failure.
- Deploy smaller, reversible changes.
- Script operations as code.
- Learn from failure and refine.

Selected Answer: A

Globally=multi-region

upvoted 2 times

SANYAM01 1 year, 6 months ago

Ans is A

upvoted 1 times

Aghajee 1 year, 6 months ago

A. Multi-Region

Using a Multi-Region architecture allows you to distribute your application across different AWS regions, providing redundancy and minimizing the impact of potential regional failures. This helps in achieving global reach and ensures better availability and performance for users in different parts of the world.

upvoted 3 times

spicymchaggis 1 year, 6 months ago

Selected Answer: A

Answer is A

While a multi-AZ deployment can provide better availability and resilience than a single-region deployment, it is not the most appropriate architecture for deploying an application globally because it does not offer the same level of performance and latency reduction as a multi-region deployment.

In a multi-AZ deployment, the application is deployed in multiple Availability Zones (AZs) within the same region. This means that the application is still subject to regional outages, which can affect users in that region. Additionally, latency to users in other regions may still be high.

A. Spot instances

upvoted 2 times

Ashisohail 1 year, 6 months ago

Selected Answer: A

Stop instance is the correct answer

upvoted 3 times

Mike1987 1 year, 6 months ago

Selected Answer: A

Spot Instances provide the largest discount compared to On-Demand prices, but they come with the caveat that they can be terminated by AWS if the capacity is needed by On-Demand or Reserved Instances. Spot Instances are suitable for workloads that can tolerate interruptions and are cost-effective for applications that have flexible start and end times or that can be distributed across multiple instances.

OOJay 1 year, 6 months ago

C. AWS Outposts

AWS Outposts allows you to deploy AWS-designed infrastructure on-premises, providing a consistent hybrid experience. With AWS Outposts, you can run compute and storage workloads locally on your premises while seamlessly connecting to the rest of AWS's broad array of services in the cloud.

In this scenario, if the company wants to keep the data local and on-premises to meet regulatory requirements and maintain low latency between AWS and on-premises resources, AWS Outposts would be the suitable option. It extends the AWS infrastructure to your on-premises location, providing a hybrid solution that combines the benefits of both on-premises and cloud resources.

D. Loosely couple components.

upvoted 1 times

Ashisohail 1 year, 6 months ago

Selected Answer: D

is the correct answer

upvoted 1 times

Mike1987 1 year, 6 months ago

Selected Answer: D

Loosely coupling components is a design principle that emphasizes minimizing dependencies between different components in a system. This helps isolate failures, meaning that if one component fails or undergoes changes, it doesn't have a significant impact on other components. This design principle contributes to increased resilience, flexibility, and easier maintenance of the overall system.

Global reach is the correct answer
upvoted 1 times

Mike1987 1 year, 6 months ago

Selected Answer: B

The benefit of cloud computing that provides the ability to deploy applications to users all over the world through a network of AWS Regions, Availability Zones, and edge locations is referred to as "Global reach." AWS has a global infrastructure with multiple Regions, each consisting of multiple Availability Zones, and edge locations for content delivery. This global reach allows companies to distribute their applications and content closer to end-users, reducing latency and improving the overall user experience.

Selected Answer: D

Cognito = User authentication for Apps

IAM Identity Center = Centralized access management for AWS and Apps

The answer is D) AWS IAM Identity Center

upvoted 2 times

chalaka 1 year, 8 months ago

Selected Answer: D

D. AWS IAM Identity Center (AWS Single Sign-On)

AWS IAM Identity Center, also known as AWS Single Sign-On (SSO), is a service that simplifies the management of access to AWS accounts and business applications by providing centralized identity and access management. With AWS SSO, companies can create and manage workforce users, control their access to AWS accounts and applications using single sign-on, and enforce multi-factor authentication for enhanced security. This service helps streamline access management and ensures consistent security practices across the organization's AWS environment.

upvoted 2 times

Zerro 1 year, 9 months ago

Selected Answer: D

I think it's D, as Cognito is more for third-part applications like credentials for facebook, etc.

upvoted 1 times

rolling_potato_ 1 year, 9 months ago

Selected Answer: D

I believe it's correct because "The AWS access portal provides IAM Identity Center users with single sign-on access to all their assigned AWS accounts and applications through a web portal." So it's centrally managed. And: ". Use IAM Identity Center with your existing identity source or create a new directory, and manage workforce access to part or all of your AWS environment."

upvoted 3 times

Selected Answer: C

C. Amazon Detective

Amazon Detective makes it easy to analyze, investigate, and quickly identify the root cause of security issues or suspicious activities. It automatically collects log data from your AWS resources and uses machine learning, statistical analysis, and graph theory to build a linked set of data that enables you to easily conduct investigations. While Amazon GuardDuty is effective for detecting threats, Amazon Detective specializes in analyzing and investigating the security findings that GuardDuty and other services detect, making it an excellent choice for efficiently conducting

security investigations with machine learning capabilities.

A company is launching a mobile app in the AWS Cloud. The company wants the app's users to sign in through social media identity providers (IdPs).

Which AWS service will meet this requirement?

- A. AWS Lambda
- B. Amazon Cognito
- C. AWS Secrets Manager
- D. Amazon CloudFront

Reveal Solution

Correct Answer: B

Community vote distribution

B (100%)

Discussion:

chalaka 1 year, 2 months ago

Selected Answer: B

B. Amazon Cognito.

Amazon Cognito is a fully managed identity service that allows you to easily add user sign-up and sign-in to your mobile and web applications. It supports social identity providers (IdPs) such as Facebook, Google, Amazon, and others, allowing users to sign in using their existing social media accounts.

Asylgul 1 year, 3 months ago

Selected Answer: B

B. Amazon Cognito

Amazon Cognito provides authentication, authorization, and user management for web and mobile apps. Users can sign in directly with a user name and password, or through third-party identity providers such as Facebook, Google, and Amazon, as well as through enterprise identity providers via SAML 2.0. Amazon Cognito facilitates the integration of social media identity providers (IdPs), making it a suitable choice for the company's mobile app to allow users to sign in through social media.

A its correct answer The complimentary AWS service that helps create data-driven business cases for cloud planning is AWS Migration Evaluator, formerly known as TSO Logic. AWS Migration Evaluator assists organizations in understanding the cost-benefits of moving to AWS by analyzing their current on-premises IT infrastructure usage and costs. It provides detailed reports and insights, enabling decision-makers to build compelling, data-driven business cases for cloud migration and planning. This tool helps in identifying the most cost-effective AWS services to meet an organization's specific needs, estimating the potential cost savings, and planning the migration strategy effectively.

Which cloud concept is demonstrated by using AWS Cost Explorer?

- A. Rightsizing
- B. Reliability
- C. Resilience
- D. Modernization

Reveal Solution

Correct Answer: A

Community vote distribution

A (100%)

Discussion:

chalaka 1 year, 2 months ago

Selected Answer: A

A. Rightsizing.

One of the key features of AWS Cost Explorer is rightsizing recommendations, which help users identify opportunities to optimize the cost and performance of their AWS resources by matching resource specifications to actual usage requirements.

upvoted 1 times

Thaluu 1 year, 2 months ago

A. Rightsizing

AWS Cost Explorer is a tool that enables you to visualize, understand, and manage your AWS costs and usage over time. This aligns with the concept of rightsizing, which involves optimizing the allocation of cloud resources based on usage and cost. By using AWS Cost Explorer, you can identify underutilized resources and make informed decisions about adjusting resource allocation to reduce costs, which is a key aspect of rightsizing.

A company wants to deploy a non-containerized Java-based web application on AWS. The company wants to use a managed service to quickly deploy the application. The company wants the service to automatically provision capacity, load balance, scale, and monitor application health.

Which AWS service will meet these requirements?

- A. Amazon Elastic Container Service (Amazon ECS)
- B. AWS Lambda
- C. Amazon Elastic Kubernetes Service (Amazon EKS)
- D. AWS Elastic Beanstalk

Asylgul 1 year, 3 months ago

Selected Answer: D

D. AWS Elastic Beanstalk

AWS Elastic Beanstalk is an easy-to-use service for deploying and scaling web applications and services developed with Java, .NET, PHP, Node.js, Python, Ruby, Go, and Docker on familiar servers such as Apache, Nginx, Passenger, and IIS. You simply upload your code, and AWS Elastic Beanstalk automatically handles the deployment, from capacity provisioning, load balancing, and auto-scaling to application health monitoring. It is ideal for non-containerized Java-based web applications, as it abstracts the underlying infrastructure, allowing developers to focus on writing code rather than managing environments

D. AWS SDKs

upvoted 1 times

Asylgul 1 year, 3 months ago

Selected Answer: D

D. AWS SDKs (Software Development Kits)

AWS SDKs provide a set of tools for developers to integrate with and manage AWS services programmatically. These SDKs support multiple programming languages, including Java, Python, .NET, Node.js, PHP, Ruby, and Go, among others, enabling developers to use the language they are most comfortable with to interact with AWS services. Through these SDKs, developers can create, configure, and manage AWS resources directly from their applications.

C. AWS Backup
upvoted 1 times

Thaluu 1 year, 2 months ago

C. AWS Backup

AWS Backup is a fully managed backup service that makes it easy to centralize and automate the back up of data across AWS services in the cloud as well as on-premises. With AWS Backup, you can configure backup policies and monitor backup activity for AWS resources in one place. This includes compute resources like EC2 instances, storage resources like EBS volumes, and database resources like RDS databases.
